COMPUTER SCIENCE		9618/43
Paper 4 Practical		October/November 2024
MARK SCHEME		
Maximum Mark: 75		
	Published	

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the October/November 2024 series for most Cambridge IGCSE, Cambridge International A and AS Level components, and some Cambridge O Level components.

PUBLISHED

Generic Marking Principles

These general marking principles must be applied by all examiners when marking candidate answers. They should be applied alongside the specific content of the mark scheme or generic level descriptions for a question. Each question paper and mark scheme will also comply with these marking principles.

GENERIC MARKING PRINCIPLE 1:

Marks must be awarded in line with:

- the specific content of the mark scheme or the generic level descriptors for the question
- the specific skills defined in the mark scheme or in the generic level descriptors for the question
- the standard of response required by a candidate as exemplified by the standardisation scripts.

GENERIC MARKING PRINCIPLE 2:

Marks awarded are always whole marks (not half marks, or other fractions).

GENERIC MARKING PRINCIPLE 3:

Marks must be awarded **positively**:

- marks are awarded for correct/valid answers, as defined in the mark scheme. However, credit is given for valid answers which go beyond the scope of the syllabus and mark scheme, referring to your Team Leader as appropriate
- marks are awarded when candidates clearly demonstrate what they know and can do
- marks are not deducted for errors
- marks are not deducted for omissions
- answers should only be judged on the quality of spelling, punctuation and grammar when these features are specifically assessed by the question as indicated by the mark scheme. The meaning, however, should be unambiguous.

GENERIC MARKING PRINCIPLE 4:

Rules must be applied consistently, e.g. in situations where candidates have not followed instructions or in the application of generic level descriptors.

GENERIC MARKING PRINCIPLE 5:

Marks should be awarded using the full range of marks defined in the mark scheme for the question (however; the use of the full mark range may be limited according to the quality of the candidate responses seen).

GENERIC MARKING PRINCIPLE 6:

Marks awarded are based solely on the requirements as defined in the mark scheme. Marks should not be awarded with grade thresholds or grade descriptors in mind.

Question	Answer	Marks
1(a)	 1 mark each to max 6: Function declaration (and close where appropriate) Declaration/use of an array (with space/initialised with 45 spaces/strings) Opening the file Data.txt for read and closing in an appropriate place Looping through all file contents/Looping 45 times and reading each line storing all items from file into array Returning the populated array Exception handling with suitable try, catch and output 	6
	<pre>e.g. Python def ReadData(): Colours = [] try: File = open("Data.txt") Colours = File.read().split("\n") File.close() return Colours except: print("No file found")</pre>	
	<pre>VB.NET Function ReadData() Dim TextFile As String = "Data.txt" Dim Colours(45) As String Try Dim FileReader As New System.IO.StreamReader(TextFile) For x = 0 To 45 Colours(x) = FileReader.ReadLine()</pre>	

Question	Answer	Marks
1(a) End	Next FileReader.Close() Catch ex As Exception Console.WriteLine("No file found") End Try Return Colours d Function	Marks
	} return Colours;	

Question	Answer	Marks
1(b)(i)	 1 mark each Function header (and end where appropriate) taking (min) one parameter Looping through each parameter array element, concatenating with space and returning 	2
	Python	
	<pre>def FormatArray(DataArray): OutputText = ""</pre>	
	for x in range(0, 45):	
	OutputText = OutputText + DataArray[x] + " "	
	return OutputText	
	VB.NET	
	Function FormatArray(DataArray)	
	Dim OutputText As String = ""	
	For $X = 0$ To 44	
	OutputText = OutputText & DataArray(X) & " " Next	
	Return OutputText	
	End Function	
	Java	
	<pre>public static String FormatArray(String[] DataArray) {</pre>	
	String OutputText = "";	
	for(Integer X = 0; X < 45; X++){	
	OutputText = OutputText + DataArray[X] + " ";	
	}	
	return OutputText;	
] }	

Question	Answer	Marks
1(b)(ii)	 1 mark each: Calling ReadData() and storing returned array calling FormatArray() with returned array Outputting return value from FormatArray() 	3
	<pre>Python Colours = ReadData() #string array print(FormatArray(Colours))</pre>	
	<pre>VB.NET Dim Colours(45) As String Colours = ReadData() Console.WriteLine(FormatArray(Colours))</pre>	
	<pre>Java String[] Colours = new String[45]; Colours = ReadData(); System.out.println(FormatArray(Colours));</pre>	
1(b)(iii)	1 mark for output showing all colours in one string	1
	e.g. beige green scarlet silver bronze slate yellow orange jade lavender magenta magnolia turquoise black grey russet mango maroon mint purp le red pink white cream navy olive brown violet cyan amber aqua azure copper fawn fuschia gold indigo ivory mauve mulberry peach periwi nkle plum rose sage	

Question	Answer	Marks
1(c)	 1 mark each Function header (and close where appropriate) taking (min) two parameters and returns a value in all cases Looping through each character in each string parameter return 1 when first parameter < second return 2 when first parameter > second 	4
	<pre>e.g. Python def CompareStrings(First, Second): Count = 0 while True: if First[Count] < Second[Count]: return 1 elif First[Count] > Second[Count]: return 2 else: Count = Count + 1</pre>	
	<pre>VB.NET Function CompareStrings(FirstS, SecondS) Dim Count As Integer = 1 While (True) If Mid(FirstS, Count, 1) < Mid(SecondS, Count, 1) Then Return 1 ElseIf Mid(FirstS, Count, 1) > Mid(SecondS, Count, 1) Then Return 2 Else Count = Count + 1 End If End While End Function</pre>	

Question	Answer	Marks
1(c)	<pre>Java public static Integer CompareStrings(String First, String Second) { Integer Count = 0; while(true) { if(First.substring(Count, Count + 1).compareTo(Second.substring(Count, Count +)) < 0) { return 1; }else if(First.substring(Count, Count + 1).compareTo(Second.substring(Count,</pre>	
1(d)(i)	<pre>1 mark each • Bubble sort function header taking array parameter and returns sorted array in all cases • Comparing strings using CompareStrings() and correctly swapping values when needed • Correct bubble sort that sorts the data correctly Python def Bubble(DataArray): ArrayLength = len(DataArray) for x in range(ArrayLength - 1): for y in range(0, ArrayLength - x - 1): Result = CompareStrings(DataArray[y], DataArray[y + 1]) if Result == 2: DataArray[y], DataArray[y+1] = DataArray[y+1], DataArray[y] return DataArray</pre>	3

Question	Answer	Marks
1(d)(i)	VB.NET	
. , . ,	Function Bubble(DataArray)	
	Dim ArrayLength As Integer = 45	
	Dim Result As Integer	
	Dim Temp As String	
	For $X = 0$ To ArrayLength - 1	
	For $Y = 0$ To ArrayLength - $X - 2$	
	Result = CompareStrings(DataArray(Y), DataArray(Y + 1))	
	If Result = 2 Then	
	Temp = DataArray(Y)	
	<pre>DataArray(Y) = DataArray(Y + 1) DataArray(Y + 1) = Temp</pre>	
	End If	
	Next	
	Next	
	Return DataArray	
	End Function	
	Java	
	<pre>public static String[] Bubble(String[] DataArray) {</pre>	
	Integer ArrayLength = 45;	
	Integer Result;	
	String Temp;	
	for(Integer X = 0; X < ArrayLength ; X++){	
	for(Integer Y = 0; Y < ArrayLength - X - 1; Y++){	
	<pre>Result = CompareStrings(DataArray[Y], DataArray[Y+1]);</pre>	

Question	Answer	Marks
1(d)(i)	<pre>if (Result == 2) {</pre>	
1(d)(ii)	<pre>1 mark each • Calling Bubble() with array as parameter and using/storing return value • Calling FormatArray() with return value from Bubble() and outputting return value Python BubbleSorted = Bubble(Colours) print(FormatArray(BubbleSorted))</pre>	2
	<pre>VB.NET Dim BubbleSorted(45) As String BubbleSorted = Bubble(Colours) Console.WriteLine(FormatArray(BubbleSorted))</pre>	
	<pre>Java String[] BubbleSorted = new String[45]; BubbleSorted = Bubble(Colours); System.out.println(FormatArray(BubbleSorted));</pre>	
1(d)(iii)	1 mark for sorted data	1
	e.g. beige green scarlet silver bronze slate yellow orange jade lavender magenta magnolia turquoise black grey russet mango maroon mint purp le red pink white cream navy olive brown violet cyan amber aqua azure copper fawn fuschia gold indigo ivory mauve mulberry peach periwi nkle plum rose sage amber aqua azure beige black bronze brown copper cream cyan fawn fuschia gold green grey indigo ivory jade lavender magenta magnolia ma ngo maroon mauve mint mulberry navy olive orange peach periwinkle pink plum purple red rose russet sage scarlet silver slate turquoise violet white yellow	

Question	Answer	Marks
2(a)(i)	 1 mark each Class Horse declaration (and end where appropriate) All 3 attributes declared as private with appropriate data types (declaration or comment) Constructor header (and end) taking 3 parameters (constructor must be within class) constructor assigns parameters to attributes 	4
	e.g. Python class Horse: definit(self, PName, PMaxFenceHeight, PPercentageSuccess): selfName = PName #String selfMaxFenceHeight = PMaxFenceHeight #Integer selfPercentageSuccess = PPercentageSuccess #Integer	
	VB.NET Class Horse Private Name As String Private MaxFenceHeight As Integer Private PercentageSuccess As Integer Sub New(PName, PMaxFenceHeight, PPercentageSuccess) Name = PName MaxFenceHeight = PMaxFenceHeight PercentageSuccess = PPercentageSuccess End Sub End Class	

Question	Answer	Marks
2(a)(i)	<pre>Java class Horse{ private static String Name; private static Integer MaxFenceHeight; private static Integer PercentageSuccess; public Horse(String PName, Integer PMaxFenceHeight, Integer PPercentageSuccess){ Name = PName; MaxFenceHeight = PMaxFenceHeight; PercentageSuccess = PPercentageSuccess; } </pre>	
2(a)(ii)	1 mark each 1 get method header with no parameter returning correct attribute (without change) 2nd get method correct	3
	<pre>e.g. Python def GetName(self): return selfName def GetMaxFenceHeight(self): return selfMaxFenceHeight</pre>	
	VB.NET Function GetName() Return Name End Function	

Question	Answer	Marks
2(a)(ii)	Function GetMaxFenceHeight() Return MaxFenceHeight End Function	
	<pre>Java public String GetName() { return Name; }</pre>	
	<pre>public Integer GetMaxFenceHeight() { return MaxFenceHeight; }</pre>	
2(b)(i)	 1 mark each Instantiating one object of type Horse with correct data and storing in first element of a 1D array Horses Instantiating second object of type Horse with correct data and storing in second index of the array Outputting name of both horse objects from array using GetName() 	5
	<pre>e.g. Python Horses = [] Horses.append(Horse("Beauty", 150, 72)) Horses.append(Horse("Jet", 160, 65)) print(Horses[0].GetName()) print(Horses[1].GetName())</pre>	
	<pre>VB.NET Dim Horses(2) As Horse Horses(0) = New Horse("Beauty", 150, 72) Horses(1) = New Horse("Jet", 160, 65) Console.WriteLine(Horses(0).GetName()) Console.WriteLine(Horses(1).GetName())</pre>	

Question	Answer	Marks
2(b)(i)	<pre>Java Horse[] Horses = new Horse[2]; Horses[0] = new Horse("Beauty", 150, 72); Horses[1] = new Horse("Jet", 160, 65); System.out.println(Horses[0].GetName()); System.out.println(Horses[1].GetName());</pre>	
2(b)(ii)	1 mark for both names output: Beauty Jet	1
2(c)(i)	 1 mark each Class Fence header (and end where appropriate) with no inheritance Height and Risk private with integer data type Constructor taking 2 parameters and storing in attributes (constructor must be within class) 2 get methods (no parameter) returning correct attributes (within class) 	4
	<pre>e.g. Python class Fence: definit(self, PHeight, PRisk): selfHeight = PHeight #integer selfRisk = PRisk #integer</pre>	
	<pre>def GetHeight(self): return selfHeight def GetRisk(self): return selfRisk</pre>	

Question	Answer	Marks
2(c)(i)	VB.NET	
	Class Fence	
	Dim Height As Integer	
	Dim Risk As Integer	
	Sub New(PHeight, PRisk)	
	Height = PHeight	
	Risk = PRisk	
	End Sub	
	Function GetHeight()	
	Return Height	
	End Function	
	Function GetRisk()	
	Return Risk	
	End Function	
	End Class	
	Java	
	<pre>class Fence{</pre>	
	private Integer Height;	
	private Integer Risk;	
	<pre>public Fence (Integer PHeight, Integer PRisk) { Height = PHeight;</pre>	
	Risk = PRisk;	
	}	

Question	Answer	Marks
2(c)(i)	<pre>public Integer GetHeight() { return Height; } public Integer GetRisk() { return Risk; }</pre>	
2(c)(ii)	<pre>1 mark each to max 5 • Declaration/use of array Course of type Fence (with at least 4 elements) • Taking Height and Risk as input four times and store/use • Instantiating a Fence object for each set of valid input values and storing in array • Taking each height as input until it is between 70 and 180 (inclusive) • Taking each risk as input until it is between 1 and 5 (inclusive) e.g. Python Course = [] for x in range(0, 4): Valid = False while Valid == False: Height = int(input("Enter the height in cm")) if(Height >= 70 and Height <= 180): Valid = True Valid = False</pre>	5
	<pre>while Valid == False: Risk = int(input("Enter the risk between 1 (easy) and 5 (hard)")) if(Risk >= 1 and Risk <= 5): Valid = True Course.append(Fence(Height, Risk))</pre>	

```
Question
                                                                                                          Marks
                                                     Answer
 2(c)(ii)
         VB.NET
         Dim Course (5) As Fence
         Dim Height As Integer
         Dim Risk As Integer
         For x = 0 To 3
            Do
                 Console.WriteLine("Enter the height in cm")
                 Height = Console.ReadLine()
            Loop Until Height >= 70 And Height <= 180
                 Console.WriteLine("Enter the risk between 1 (easy) and 5 (hard)")
                 Risk = Console.ReadLine()
            Loop Until Risk >= 1 And Risk <= 5
            Course(x) = New Fence(Height, Risk)
         Next
         Java
         Fence [] Course = new Fence [4];
         for (Integer x = 0; x < 4; x++) {
               do {
                    System.out.println("Enter the height in cm");
                    Height = Integer.parseInt(scanner.nextLine());
               } while (Height < 70 \mid \mid Height > 180);
               do{
                    System.out.println("Enter the risk between 1 (easy) and 5 (hard)");
                    Risk = Integer.parseInt(scanner.nextLine());
               \{while (Risk < 1 \mid | Risk > 5)\}
                    Course[x] = new Fence(Height, Risk);
```

Question	Answer	Marks
2(d)	 1 mark each Method header taking 2 parameters (and end where appropriate, returning real) Checking if fence height parameter is more than max attribute for that horse, if true multiplying percentage success by 0.2 (Otherwise) selection checking risk value parameter between 1 and 5, multiplying modifier by percentage success Returning correct value as a real number in all instances Correct use of attributes and parameters throughout 	5
	<pre>e.g. Python def Success(self, Height, Risk): if Height > selfMaxFenceHeight: return selfPercentageSuccess * 0.2 else: if Risk == 1: return selfPercentageSuccess elif Risk == 2: return selfPercentageSuccess * 0.9 elif Risk == 3: return selfPercentageSuccess * 0.8 elif Risk == 4: return selfPercentageSuccess * 0.7 else: return selfPercentageSuccess * 0.6</pre>	
	<pre>VB.NET Function Success(Height, Risk)</pre>	

Question	Answer	Marks
Question 2(d)	If Risk = 1 Then Return PercentageSuccess ElseIf Risk = 2 Then Return PercentageSuccess * 0.9 ElseIf Risk = 3 Then Return PercentageSuccess * 0.8 ElseIf Risk = 4 Then Return PercentageSuccess * 0.7 Else Return PercentageSuccess * 0.6 End If End If End If End If End If End If End Function Java public static Double Success(Integer Height, Integer Risk) { if (Height > MaxFenceHeight) { return Double.valueOf(PercentageSuccess) * 0.2; }else { if (Risk == 1) { return Double.valueOf(PercentageSuccess); }else if (Risk == 2) { return Double.valueOf(PercentageSuccess) * 0.9; }else if (Risk == 3) { return Double.valueOf(PercentageSuccess) * 0.8; }else if (Risk == 4) { return Double.valueOf(PercentageSuccess) * 0.7; }else { return Double.valueOf(PercentageSuccess) * 0.6; }	Marks
	<pre>} </pre>	

Question	Answer	Marks
2(e)(i)	 1 mark each Calling Success() for each horse with the height and risk of all 4 fences using get methods for height and risk of each fence outputting the horse name, fence number and calculated success at fence in appropriate message 	3
	<pre>e.g. Python for y in range(0, 2): for x in range(0, 4): Chance = Horses[y].Success(Course[x].GetHeight(), Course[x].GetRisk()) print(Horses[y].GetName(), "Fence", x + 1, "chance of success is", Chance, "%")</pre>	
	<pre>VB.NET Dim Chance As Single For y = 0 To 1 For x = 0 To 3</pre>	
	<pre>Java Double Chance = 0.0; for(Integer y = 0; y < 2; y ++) { for(Integer x = 0; x < 4; x++) { Chance = Horses[y].Success(Course[x].GetHeight(), Course[x].GetRisk());</pre>	

Question	Answer	Marks
2(e)(ii)	 1 mark each Calculating average of all 4 fences for each horse and outputting in suitable message Identifying the highest percentage of success and outputting the horse's name in an appropriate message 	2
	<pre>e.g. Python AverageSuccess = [] for y in range(0, 2): Total = 0 for x in range(0, 4): Chance = Horses[y].Success(Course[x].GetHeight(), Course[x].GetRisk()) print(Horses[y].GetName(), "Fence", x + 1, "chance of success is", Chance, "%") Total = Total + Chance Average = Total / 4 AverageSuccess.append(Average) print(Horses[y].GetName(), "average success rate is", Average, "%")</pre>	
	<pre>Highest = AverageSuccess[0] Winner = -1 for x in range(1,2): if Highest < AverageSuccess[x]: Winner = x Highest = AverageSuccess[x] print(Horses[Winner].GetName(), " has the highest average chance of success ")</pre>

Question	Answer	Marks
3(a)	 1 mark each LinkedList declared as 2D array with (min) 20 × 2 elements (Integer) with all data initialised to -1, all nodes linked correctly (Global) FirstNode (Int) initialised as -1 and (global) FirstEmpty (Int) initialised as 0 	2
	VB.NET Dim LinkedList(20, 2) As Integer Dim FirstNode As Integer Dim FirstEmpty As Integer	
	<pre>Sub Main(args As String()) FirstNode = -1 FirstEmpty = 0 For x = 0 To 18 LinkedList(x, 0) = -1 LinkedList(x, 1) = x + 1</pre>	
	<pre>Next LinkedList(19, 0) = -1 LinkedList(19, 1) = -1 End Sub</pre>	

```
Question
                                                                                                        Marks
                                                    Answer
  3(a)
         Python
         LinkedList = [] #global
         FirstNode = -1
         FirstEmpty = 0
         for x in range (0, 19):
            LinkedList.append([-1, x + 1])
         LinkedList[19][0] = -1
         LinkedList[19][1] = -1
         Java
         private static Integer[][] LinkedList = new Integer[20][2];
         private static Integer FirstNode;
         private static Integer FirstEmpty;
         public static void main(String args[]){
              FirstNode = -1;
              FirstEmpty = 0;
              for (Integer X = 0; X < 19; X++) {
                    LinkedList[X][0] = -1;
                    LinkedList[X][1] = X + 1;
               LinkedList[19][0] = -1;
               LinkedList[19][1] = -1;
```

Question	Answer	Marks
3(b)	 1 mark each to max 6 Procedure header (and end) taking (min) 5 data items as input from the user Checking if linked list is full (FirstEmpty = -1) ending procedure/loop/not doing anything further 	6
	 (otherwise) LinkedList[FirstEmpty, 0] = data input LinkedList[FirstEmpty, 1] = FirstNode FirstNode = FirstEmpty FirstEmpty = LinkedList[FirstEmpty, 1] before any update to FirstEmpty 's pointer 	
	<pre>e.g. Python def InsertData(): global LinkedList global FirstNode global FirstEmpty for _ in range(5): if FirstEmpty != -1: nextEmpty = LinkedList[FirstEmpty][1] LinkedList[FirstEmpty][0] = int(input("Value: ")) LinkedList[FirstEmpty][1] = FirstNode FirstNode = FirstEmpty FirstEmpty = nextEmpty</pre>	

Question	Answer	Marks
3(b)	VB.NET	
	Sub InsertData()	
	Dim NewItem As Integer	
	Dim NextEmpty As Integer	
	For $x = 0$ To 4	
	Console.WriteLine("Enter the next number")	
	<pre>NewItem = Console.ReadLine()</pre>	
	If $FirstEmpty = -1$ Then	
	x = 5	
	Else	
	<pre>NextEmpty = LinkedList(FirstEmpty, 1)</pre>	
	LinkedList(FirstEmpty, 0) = NewItem	
	LinkedList(FirstEmpty, 1) = FirstNode	
	FirstNode = FirstEmpty	
	FirstEmpty = NextEmpty	
	End If	
	Next x	
	End Sub	
		1

Question	Answer	Marks
3(b)	Java	
, ,	<pre>public static void InsertData() {</pre>	
	Integer NewItem;	
	<pre>Integer CurrentPointer = 0;</pre>	
	<pre>Integer PreviousPointer = 0;</pre>	
	Scanner scanner = new Scanner(System.in);	
	<pre>Integer NextEmpty;</pre>	
	for(Integer X = 0; X < 5; X++){	
	System.out.println("Enter the next number");	
	<pre>NewItem = Integer.parseInt(scanner.nextLine());</pre>	
	$if(FirstEmpty == -1)$ {	
	X = 5;	
	}else{	
	<pre>NextEmpty = LinkedList[FirstEmpty][1];</pre>	
	<pre>LinkedList[FirstEmpty][0] = NewItem;</pre>	
	<pre>LinkedList[FirstEmpty][1] = FirstNode;</pre>	
	<pre>FirstNode = FirstEmpty;</pre>	
	<pre>FirstEmpty = NextEmpty;</pre>	
	}	
	 	
	}	

Question	Answer	Marks
3(c)(i)	 1 mark each Procedure header (and end) starting with node at index FirstNode and outputting data LinkedList[FirstNode, 0] Following pointers until end reached and outputting data for each node 	2
	<pre>Python def OutputLinkedList(): global LinkedList global FirstNode global FirstEmpty CurrentPointer = FirstNode Flag = True while Flag: print(LinkedList[CurrentPointer][0]) CurrentPointer = LinkedList[CurrentPointer][1] if CurrentPointer == -1: Flag = False</pre>	
	<pre>VB.NET Sub OutputLinkedList() Dim CurrentPointer As Integer = FirstNode Dim Flag As Boolean = True While Flag</pre>	

Question	Answer	Marks
3(c)(i)	End Sub	
	<pre>Java public static void OutputLinkedList() { Integer CurrentPointer = FirstNode; Boolean Flag = true; while (Flag) { System.out.println(LinkedList[CurrentPointer][0]);</pre>	
3(c)(ii)	1 mark for calling InsertData() then OutputLinkedList()	1
	<pre>Python InsertData() OutputLinkedList()</pre>	
	<pre>VB.NET InsertData() OutputLinkedList()</pre>	
	<pre>Java InsertData(); OutputLinkedList();</pre>	
3(c)(iii)	1 mark for inputs of 5 1 2 3 8 and output of 8 3 2 1 5	1

Question	Answer	Marks
3(d)(i)	 1 mark each to max 5 Procedure header (and end) with parameter Checking data in FirstNode against parameter (if found) updating FirstNode to LinkedList[FirstNode, 1] (Otherwise) following pointers in loop/recursive call comparing to data to remove each time storing previous pointer through each loop when found, updating previous pointer to found node's pointer 	5
	<pre> • Adding deleted node to end of/start of empty list (and updating FirstEmpty if needed) Python def RemoveData(ItemToRemove): global LinkedList global FirstNode global FirstEmpty if LinkedList[FirstNode][0] == ItemToRemove: NewFirst = LinkedList[FirstNode][1] LinkedList[FirstNode][1] = FirstEmpty FirstEmpty = FirstNode FirstNode = NewFirst </pre>	
	<pre>else: if FirstNode != -1: CurrentPointer = FirstNode PreviousNode = -1 while(ItemToRemove != LinkedList[CurrentPointer][0] and CurrentPointer != -1):</pre>	

```
Question
                                                                                                        Marks
                                                    Answer
         VB.NET
 3(d)(i)
         Sub RemoveData(ItemToRemove)
             If LinkedList(FirstNode, 0) = ItemToRemove Then
                 Dim NewFirst As Integer = LinkedList(FirstNode, 1)
                 LinkedList(FirstNode, 1) = FirstEmpty
                 FirstEmpty = FirstNode
                 FirstNode = NewFirst
             Else
                 If FirstNode <> -1 Then
                     Dim CurrentPointer As Integer = FirstNode
