Published

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the May/June 2024 series for most Cambridge IGCSE, Cambridge International A and AS Level and Cambridge Pre-U components, and some Cambridge O Level components.

Generic Marking Principles

These general marking principles must be applied by all examiners when marking candidate answers. They should be applied alongside the specific content of the mark scheme or generic level descriptions for a question. Each question paper and mark scheme will also comply with these marking principles.

GENERIC MARKING PRINCIPLE 1: Marks must be awarded in line with: • the specific content of the mark scheme or the generic level descriptors for the question • the specific skills defined in the mark scheme or in the generic level descriptors for the question • the standard of response required by a candidate as exemplified by the standardisation scripts.
GENERIC MARKING PRINCIPLE 2: Marks awarded are always **whole marks** (not half marks, or other fractions).
GENERIC MARKING PRINCIPLE 3: Marks must be awarded **positively**: • marks are awarded for correct/valid answers, as defined in the mark scheme. However, credit is given for valid answers which go beyond the scope of the syllabus and mark scheme, referring to your Team Leader as appropriate • marks are awarded when candidates clearly demonstrate what they know and can do • marks are not deducted for errors • marks are not deducted for omissions • answers should only be judged on the quality of spelling, punctuation and grammar when these features are specifically assessed by the question as indicated by the mark scheme. The meaning, however, should be unambiguous.
GENERIC MARKING PRINCIPLE 4: Rules must be applied consistently, e.g. in situations where candidates have not followed instructions or in the application of generic level descriptors.

GENERIC MARKING PRINCIPLE 5:

Marks should be awarded using the full range of marks defined in the mark scheme for the question (however; the use of the full mark range may be limited according to the quality of the candidate responses seen).

GENERIC MARKING PRINCIPLE 6:

Marks awarded are based solely on the requirements as defined in the mark scheme. Marks should not be awarded with grade thresholds or grade descriptors in mind.

Question	Answer	Marks

1(a)	1 mark for:
	• Declaration of (global) array with identifier `DataStored` (Integer and 20 spaces) **and** `NumberItems` (Integer)
	e.g.
	Java
	`public static Integer[] DataStored = new Integer[20];`
	`public static Integer NumberItems= 0;`
	
	VB.NET
	`Dim DataStored(19) As Integer`
	`Dim NumberStored As Integer = 0`
	
	Python
	`global DataStored #integer`
	`global NumberItems #Integer 20 items`
		1

Question	Answer	Marks

1(b)	1 mark each
	• Procedure heading (and close where appropriate) with **no** parameter.
	• Prompt/output of suitable message to request the input of the quantity of numbers **and** reading in quantity of numbers **and** storing/using …
	• … validating between 1 and 20 inclusive
	• Looping quantity input number of times, taking an **integer** input each time …
	• ... storing each input in next space in `DataStored`
	e.g.
	Java
	<pre>public static void Initialise(){
	    Scanner scanner = new Scanner(System.in);
	    Integer Quantity = 0;
	    do{
	        System.out.println("How many numbers will you enter up to 20?");
	        Quantity = Integer.parseInt(scanner.nextLine());
	    }while(Quantity <= 0 || Quantity > 20);
	    for(Integer X = 0; X < Quantity; X++){
	        System.out.println("Enter number");
	        DataStored[NumberItems] = Integer.parseInt(scanner.nextLine());
	        NumberItems++;
	    }
	}</pre>
	VB.NET
	<pre>Sub Initialise()
	   Console.WriteLine("How many numbers will you enter?")
	   Dim Quantity As Integer
	   Do
	      Quantity = Console.ReadLine()
	    Loop Until (Quantity > 0 And Quantity < 21)
	   For Count = 0 To Quantity - 1
	      Console.WriteLine("Enter number")
	      DataStored(NumberStored) = Console.ReadLine()
	      NumberStored += 1
	   Next
	End Sub</pre>
		5

Question	Answer	Marks

1(b)	Python
	``python
	def Initialise():
	    global DataStored
	    global NumberItems
	    Valid = False
	    while(Valid == False):
	        NumberItems = int(input("How many numbers will you enter?")) #loop until < 20
	        if NumberItems > 0 and NumberItems< 21:
	            Valid = True
	    for Count in range(0, NumberItems):
	        DataStored.append(int(input("Enter number")))
	``	

1(c)(i)	1 mark each:
	• Storing 0 in `NumberItems` **and** then calling `Initialise()`
	• Outputting all contents of array `DataStored`
	e.g.
	Java
	``java
	public static Integer NumberItems= 0;
	Initialise();
	for(Integer X = 0; X < NumberItems; X++){
	    System.out.println(DataStored[X]);
	``
	
	VB.NET
	``
	NumberItems = 0
	Initialise()
	For X = 0 To NumberItems - 1
	    Console.WriteLine(DataStored(X))
	Next
	``
	
	Python
	``python
	NumberItems = 0
	Initialise()
	print(DataStored)
	``
		2

Question	Answer	Marks

1(c)(ii)	1 mark each
	• Output showing quantity entered twice (30 and 5) with first being invalid
	• Array output 3 9 4 1 2
	e.g.
	`How many numbers will you enter?30`
	`How many numbers will you enter?5`
	`Enter number3`
	`Enter number9`
	`Enter number4`
	`Enter number1`
	`Enter number2`
	`[3, 9, 4, 1, 2]`
		2

Question	Answer	Marks
1(d)(i)	1 mark each • Procedure header (and end where appropriate) **and** looping through each array element • Working **inner** loop … • …comparison of elements… • …swapping of elements e.g. Java	**4**

```java
public static void BubbleSort(){
        Integer Temp = 0;
        for(Integer Count = 0; Count < NumberItems; Count++){
                for(Integer Count2 = 0; Count2 < NumberItems - 1; Count2++){
                        if(DataStored[Count2] > DataStored[Count]){
                                Temp = DataStored[Count2];
                                DataStored[Count2] = DataStored[Count];
                                DataStored[Count] = Temp;
                        }
                }
        }
}
```

VB.NET

```vbnet
Sub BubbleSort()
    Dim Temp As Integer
    For Count = 0 To NumberStored - 1
        For Count2 = 0 To NumberStored - 2
            If (DataStored(Count2) > DataStored(Count)) Then
                Temp = DataStored(Count)
                DataStored(Count) = DataStored(Count2)
                DataStored(Count2) = Temp
            End If
        Next
    Next
End Sub
```

Question	Answer	Marks

1(d)(i)	Python
	``python
	def BubbleSort():
	    global DataStored
	    global NumberItems
	    for Count in range(0, NumberItems):
	        for Count2 in range(0, NumberItems-1):
	            if DataStored[Count2] > DataStored[Count]:
	                DataStored[Count2], DataStored[Count] = DataStored[Count], DataStored[Count2]
	``	

1(d)(ii)	1 mark for calling `BubbleSort()` **and** outputting array contents after
	e.g.
	VB.NET
	``
	BubbleSort()
	For X = 0 To NumberStored - 1
	    Console.WriteLine(DataStored(X))
	Next
	``
	
	e.g. Java
	``
	BubbleSort();
	for(Integer X = 0; X < NumberItems; X++){
	    System.out.println(DataStored[X]);
	}
	``
	e.g. Python
	``
	BubbleSort()
	print(DataStored)
	``
		1

1(d)(iii)	1 mark for screenshot showing the inputs and the values in the correct order e.g. ``` How many numbers will you enter?5 Enter number3 Enter number9 Enter number4 Enter number1 Enter number2 [1, 2, 3, 4, 9] ```	1

Question	Answer	Marks

1(e)(i)	1 mark each
	• Function header `BinarySearch` taking `DataToFind` as a parameter
	• Calculating the mid value `(First + Last) \ 2` or equivalent **inside loop**
	• Checking if the data at `mid` is the parameter **and** returning `mid` **inside loop**
	• If `DataToFind < mid`, updating `Last/Upper` with `mid - 1` **inside loop**
	• If `DataToFind > mid`, updating `First/Lower` with `mid + 1` **inside loop**
	• Returning `-1` when not found **and** a suitable loop with end criteria
	e.g.
	Java
	
	``java
	public static Integer BinarySearch(Integer DataToFind){
	        Integer MidValue = 0;
	        Integer First = 0;
	        Integer Last = NumberItems;
	        while (First <= Last){
	                MidValue = (First + Last) / 2;
	                if(DataToFind == DataStored[MidValue]){
	                        return MidValue;
	                }
	                if(DataToFind < DataStored[MidValue]){
	                        Last = MidValue - 1;
	                }else{
	                        First = MidValue + 1;
	                }
	        }
	        return -1;
	}
	``
		6

Question	Answer	Marks

1(e)(i)	VB.NET
	
	``vbnet
	Function BinarySearch(DataToFind)
	    Dim First As Integer = 0
	    Dim Last As Integer = NumberItems
	    Dim MidValue As Integer
	    While (First <= Last)
	        MidValue = (First + Last) / 2
	        If DataToFind = DataStored(MidValue) Then
	            Return MidValue
	        End If
	        If DataToFind < DataStored(MidValue) Then
	            Last = MidValue - 1
	        Else
	            First = MidValue + 1
	        End If
	    End While
	    Return -1
	End Function
	``
	
	Python
	
	``python
	def BinarySearch(DataToFind):
	    global DataStored
	    global NumberItems
	    First = 0
	    Last= NumberItems
	    while(First <= Last):
	        MidValue = int((First + Last) / 2)
	
	        if DataToFind == DataStored[MidValue]:
	            return MidValue
	        if DataToFind < DataStored[MidValue]:
	            Last = MidValue - 1
	        else:
	            First = MidValue + 1
	
	    return -1
	``	

Question	Answer	Marks

1(e)(ii)	1 mark each:
	• Taking number as input
	• … calling `BinarySearch` with input
	• Outputting value returned
	e.g.
	Java
	<pre>Scanner scanner = new Scanner(System.in);
	System.out.println("Enter a number to find");
	Integer Search = Integer.parseInt(scanner.nextLine());
	System.out.println(BinarySearch(Search));</pre>
	VB.NET
	<pre>Console.WriteLine("Enter a number to find")
	Dim Search As Integer = Console.ReadLine()
	Console.WriteLine(BinarySearch(Search))</pre>
	Python
	<pre>Search = int(input("Enter a number to find"))
	print(BinarySearch(Search))</pre>
		3

Question	Answer	Marks
1(e)(iii)	1 mark for each test e.g. Test 1 – Accept found in index 16 ``` How many numbers will you enter?5 Enter number1 Enter number6 Enter number2 Enter number8 Enter number10 [1, 2, 6, 8, 10] Enter a number to find2 1 ``` Test 2 ``` How many numbers will you enter?5 Enter number1 Enter number6 Enter number2 Enter number8 Enter number10 [1, 2, 6, 8, 10] Enter a number to find7 -1 ```	**2**

Question	Answer	Marks
| 2(a)(i) | 1 mark each to max 4<br>• Class `Tree` declaration (and end where appropriate)<br>• All 5 attributes declared as private with correct identifiers and data types<br>• Constructor header (and end) taking 5 parameters<br>• Constructor assigns parameters to attributes<br>e.g.<br>Java<br><br>```java
class Tree{
    private String TreeName;
    private Integer HeightGrowth;
    private Integer MaxWidth;
    private Integer MaxHeight;
    private String Evergreen;

    public Tree(String Name, Integer HGrowth, Integer MaxH, Integer MaxW, String PEvergreen){
        TreeName = Name;
        HeightGrowth = HGrowth;
        MaxWidth = MaxW;
        MaxHeight = MaxH;
        Evergreen = PEvergreen;
}}
``` | **4** |

Question	Answer	Marks

2(a)(i)	VB.NET
	``
	Class Tree
	    Private TreeName As String
	    Private HeightGrowth As Integer
	    Private MaxHeight As Integer
	    Private MaxWidth As Integer
	    Private Evergreen As String
	    Sub New(Name, HGrowth, MaxH, MaxW, PEvergreen)
	        TreeName = Name
	        HeightGrowth = HGrowth
	        MaxHeight = MaxH
	        MaxWidth = MaxW
	        Evergreen = PEvergreen
	    End Sub
	End Class
	``
	
	Python
	``
	class Tree:
	    def __init__(self, Name, HGrowth, MaxH, MaxW, PEvergreen):
	        self.__TreeName = Name
	        self.__HeightGrowth = HGrowth
	        self.__MaxHeight = MaxH
	        self.__MaxWidth = MaxW
	        self.__Evergreen = PEvergreen
	``	

Question	Answer	Marks

2(a)(ii)	1 mark each
	• 1 get method with no parameter …
	• … returning correct attribute
	• Remaining 4 correct
	e.g.
	Java
	<pre>public String GetTreeName(){
	     return TreeName;
	}
	public Integer GetGrowth(){
	     return HeightGrowth;
	}
	public Integer GetMaxWidth(){
	     return MaxWidth;
	}
	public Integer GetMaxHeight(){
	     return MaxHeight;
	}
	public String GetEvergreen(){
	     return Evergreen;
	}</pre>
		3

Question	Answer	Marks

2(a)(ii)	VB.NET
	``
	Function GetTreeName()
	    Return TreeName
	End Function
	Function GetMaxHeight()
	    Return MaxHeight
	End Function
	Function GetMaxWIdth()
	    Return MaxWidth
	End Function
	Function GetGrowth()
	    Return HeightGrowth
	End Function
	Function GetEvergreen()
	    Return Evergreen
	End Function
	``
	
	Python
	``
	def GetTreeName(self):
	    return self.__TreeName
	def GetMaxHeight(self):
	    return self.__MaxHeight
	def GetMaxWidth(self):
	    return self.__MaxWidth
	def GetGrowth(self):
	    return self.__HeightGrowth
	def GetEvergreen(self):
	    return self.__Evergreen
	``	

Question	Answer	Marks
| 2(b) | 1 mark for:<br>•   appropriate use of exception handling, with catch and output<br>1 mark each to max 6<br>•   Function header (and end where appropriate) **and** declaration of array (of type `Tree` with min 9 elements)<br>•   Opening text file `Trees.txt` to read **and** closing the file<br>•   Reading each line of text (until EOF, or 9 times)<br>•   Splitting each line into the 5 elements …<br>•   … casting height growth, max height and max width to integers<br>•   … creating a new object of type `Tree` with the 5 values<br>•   … storing each object in the array **and** returning the array<br>e.g.<br>Java<br><br>```java
public static Tree[] ReadData(){
      String TextFile = "Trees.txt";
      String[] TempData = new String[5];
      Tree[] TreeData = new Tree[20];
      String Line;
      try{
            FileReader f = new FileReader(TextFile);
            BufferedReader Reader = new BufferedReader(f);
            for(Integer X = 0; X < 9; X++){
                  try{
                        Line = Reader.readLine();
                        TempData = Line.split(",");
                        TreeData[X] = new Tree(TempData[0], Integer.parseInt(TempData[1]),
Integer.parseInt(TempData[2]), Integer.parseInt(TempData[3]), TempData[4]);
                  }catch(IOException ex){}
            }
            try{
                  Reader.close();
            }catch(IOException ex){}

      }catch(FileNotFoundException e){
            System.out.println("File not found");
      }
      return TreeData;
}
``` | 7 |
Question	Answer	Marks
| 2(b) | **VB.NET**<br><br>```vbnet
  Function ReadData()
        Dim TreeObjects(10) As Tree
        Dim TextFile As String = "Trees.txt"
try
        Dim FileReader As New System.IO.StreamReader(TextFile)
        Dim TreeData(10) As String
        Dim TreeSplit() As String
        For Count = 0 To 8
            TreeData(Count) = FileReader.ReadLine()

        Next Count
        FileReader.Close()

        For X = 0 To 8

            TreeSplit = TreeData(X).Split(",")
            TreeObjects(X) = New Tree(TreeSplit(0), Integer.Parse(TreeSplit(1)),
Integer.Parse(TreeSplit(2)), Integer.Parse(TreeSplit(3)), TreeSplit(4))
        Next X
Catch ex As Exception
        Console.WriteLine ("invalid file")
End Try
        Return TreeObjects

    End Function
``` | |

Question	Answer	Marks

2(b)	Python
	<pre>def ReadData():
	    TreeObjects=[]
	    try:
	        File = open("Trees.txt")
	        TreeData = []
	        TreeData = File.read().split("\n")
	        SplitTrees = []
	        for Item in TreeData:
	            SplitTrees.append(Item.split(","))
	        File.close()
	        for Item in SplitTrees:
	            TreeObjects.append(Tree(Item[0],int(Item[1]),int(Item[2]),int(Item[3]),
	Item[4]))
	    except IOError:
	        print ("invalid file")
	    return TreeObjects</pre>	

Question	Answer	Marks
2(c)	1 mark each • Procedure heading (and end) taking **one** parameter (of type `Tree`) **and** using get methods to access tree name, height, width, growth • Outputs all 4 attributes (`TreeName`, `MaxHeight`, `MaxWidth`, `GetGrowth`) • Checks if it is evergreen… • … correct messages are output if evergreen and otherwise e.g. Java <pre>public static void PrintTrees(Tree TreeItem){
String Final = "does not lose its leaves";
if((TreeItem.GetEvergreen()).compareTo("No") == 0){
Final = "loses its leaves each year";
}
System.out.println(TreeItem.GetTreeName() + " has a maximum height " +
TreeItem.GetMaxHeight() + " a maximum width " + TreeItem.GetMaxWidth() + " and grows " +
TreeItem.GetGrowth() + " cm a year. It " + Final);
}</pre> VB.NET <pre>Sub PrintTrees(Item)
Dim Final As String = "does not lose its leaves"
If (Item.GetEvergreen() = "No") Then
Final = "loses its leaves each year"
End If
Console.WriteLine(Item.GetTreeName() & " has a maximum height " &
Item.GetMaxHeight() & " a maximum width " & Item.GetMaxWidth() & " and grows " &
Item.GetGrowth() & "cm a year. It" & Final)
End Sub</pre>	**4**

Question	Answer	Marks

2(c)	Python
	``
	def PrintTrees(Item):
	
	    Final = "does not lose its leaves"
	    if Item.GetEvergreen() == "No":
	        Final = "loses its leaves each year"
	    print(Item.GetTreeName(), "has a maximum height", Item.GetMaxHeight(),"a maximum
	width",Item.GetMaxWidth(),"and grows", Item.GetGrowth(),"cm a year. It",Final)
	``	

2(d)(i)	• 1 mark each
	• Calling `ReadData()` **and** storing/using return value (as array of type `Tree`) …
	• … calling `PrintTrees()` with first object in returned array as parameter
	
	e.g.
	Java
	``
	Tree[] TreeData = new Tree[20];
	TreeData = ReadData();
	PrintTrees(TreeData[0]);
	``
	
	VB.NET
	``
	Sub Main(args As String())
	        Dim TreeObjects(10) As Tree
	        TreeObjects = ReadData()
	        PrintTrees(Treeobjects(0))
	End Sub
	``
	
	Python
	``
	TreeObjects = ReadData()
	PrintTrees(TreeObjects[0])
	``
		2

2(d)(ii)	Screenshot showing output `Beech has a maximum height 400 a maximum width 200 and grows 30 cm a year. It loses its leaves each year`	**1**

Question	Answer	Marks

2(e)(i)	1 mark each to max 6
	• Procedure header (and close) taking array of `Tree` objects as a parameter **and** reading evergreen, max height and max width **once** as input from the user
	
	• Looping through each array object …
	• … comparing each width input >= `MaxWidth`, height input >= `MaxHeight`
	• … comparing each evergreen input with `Evergreen`
	… **when all true** (all requirements met) - appending object in new array
	• Calling `PrintTrees()` with each valid object
	• Outputting suitable message if no trees appropriate
	
	e.g.
	Java
	<pre>public static void ChooseTree(Tree[] Trees){
	    Scanner scanner = new Scanner(System.in);
	    System.out.println("Do you want a tree that loses its leaves (enter lose), or keeps
	its leaves (enter keep)") ;
	    String Evergreen = (scanner.nextLine());
	    System.out.println("What is the maximum tree height in cm");
	    Integer MaxHeight = Integer.parseInt(scanner.nextLine());
	    System.out.println("What is the maximum tree width in cm");
	    Integer MaxWidth = Integer.parseInt(scanner.nextLine());
	    Tree[] Options = new Tree[20];
	    String keep;
	    Tree Selected;
	    Boolean Valid = false;
	    if(((Evergreen.toLowerCase()).compareTo("keep") == 0) ||
	((Evergreen.toLowerCase()).compareTo("keep leaves") == 0) ||
	((Evergreen.toLowerCase()).compareTo("keeps its leaves") == 0)){
	        keep = "Yes";
	    }else{
	        keep = "No";
	    }

         Years =  (Selected.GetMaxHeight() - Start)/Selected.GetGrowth()
         print("Your tree should be full height in approximately", Years,"years")
```

Question	Answer	Marks
2(e)(iii)	1 mark each • Screenshot shows the user requirements input (height 400, width 200, evergreen) **and** outputs the correct trees (Blue conifer and green conifer) • Screenshot shows the tree selection input (Blue Conifer with height 100) **and** outputs the correct result (3 years / 3.75 / 4 years) Beech has a maximum height 400 a maximum width 200 and grows 30 cm a year. It loses its leaves each year Do you want a tree that loses its leaves (enter lose), or keeps its leaves (enter keep)keep What is the maximum tree height in cm400 What is the maximum tree width in cm200 Blue Conifer has a maximum height 250 a maximum width 50 and grows 40 cm a year. It does not lose its leaves Green Conifer has a maximum height 300 a maximum width 150 and grows 40 cm a year. It does not lose its leaves Enter the name of the tree you wantBlue Conifer Enter the height of the tree you would like to start with in cm100 Your tree should be full height in approximately 3.75 years	**2**

Question	Answer	Marks

3(a)	1 mark each
	
	• `QueueData` **as 1D (string) array initialised to 20 null values**
	     and `QueueHead` **initialised to** `-1`, `QueueTail` **initialised to** `-1`
	
	e.g.
	Java
	<pre>class Queue{
	    public static String[] QueueData = new String[20];
	    public static Integer QueueHead;
	    public static Integer QueueTail;
	    public static void main(String args[]){
	        for(Integer x = 0; x < 20; x++){
	            QueueData[x] = "";
	        }
	        QueueHead = -1;
	        QueueTail = -1;
	    }
	}</pre>VB.NET
	<pre> Dim QueueData(0 To 20) As String
	  Dim QueueHead As Integer = -1
	  Dim QueueTail As Integer = -1
	Sub Main(args As String())
	    For x = 0 To 19
	        QueueData(x) = ""
	    Next
	End Sub</pre>Python
	<pre>global QueueData
	global QueueHead
	global QueueTail
	QueueData = []
	for x in range(0, 20):
	    QueueData.append("")
	QueueHead = -1
	QueueTail = -1</pre>
		1

Question	Answer	Marks

3(b)	1 mark each
	• Function header (and end) taking **one** parameter **and** returns a Boolean value in all instances
	• Checks if queue is full **and** returns FALSE
	• (If not full) Inserts data item to QueueTail + 1
	  and increments QueueTail
	  and returns TRUE
	• Assigns QueueHead to 0 when first element is entered (this can come from incrementing)
	e.g.
	Java
	<pre>public static Boolean Enqueue(String DataToInsert){
	    if(QueueTail == 19){
	        return false;
	    }else if(QueueHead == -1){
	        QueueHead = 0;
	    }
	    QueueTail = QueueTail + 1;
	    QueueData[QueueTail] = DataToInsert.substring(0,6);
	    return true;
	}</pre>VB.NET
	<pre> Function Enqueue(ByVal DataToInsert)
	    If QueueTail = 19 Then
	        Return False
	    ElseIf QueueHead = -1 Then
	        QueueHead = 0
	    End If
	    QueueTail = QueueTail + 1
	    QueueData(QueueTail) = DataToInsert
	    Return True
	  End Function</pre>
		4

Question	Answer	Marks

3(b)	Python
	
	``python
	def Enqueue(DataToInsert):
	    global QueueData
	    global QueueHead
	    global QueueTail
	    if QueueTail == 19:
	        return False
	    elif QueueHead == -1:
	        QueueHead = 0
	    QueueTail = QueueTail + 1
	    QueueData.append(DataToInsert)
	    return True
	``	

Question	Answer	Marks

3(c)	1 mark each
	• `Dequeue` function header (and end) returning a **string** in all cases
	• Check if queue is empty
	  and return `"false"`
	• (otherwise) remove value at `QueueHead`
	  and increment `QueueHead`
	  and return value from array
	e.g.
	Java
	<pre>public static String Dequeue(){
	    if(QueueHead < 0 || QueueHead > 20 || QueueHead > QueueTail){
	        return "false";
	    }
	    QueueHead++;
	    return QueueData[QueueHead-1];
	}</pre>VB.NET
	<pre> Function Dequeue()
	    If QueueHead < 0 Or QueueHead > 20 Or QueueHead > QueueTail Then
	        Return "false"
	    Else
	        QueueHead = QueueHead + 1
	        Return QueueData(QueueHead - 1)
	    End If
	End Function</pre>
		3

Question	Answer	Marks

3(c)	Python
	``python
	def Dequeue():
	    global QueueData
	    global QueueHead
	    global QueueTail
	    if QueueHead < 0 or QueueHead > 20 or QueueHead > QueueTail:
	        return False
	    else:
	        QueueHead = QueueHead + 1
	
	        return QueueData[QueueHead-1]
	``	

3(d)(i)	1 mark each to max 6
	• `StoreItems` header (function/procedure and end where appropriate) **and** takes 10 inputs
	• Input is split and first 6 characters used in calculation (as integers) …
	• … multiplication by 1 and 3 alternately, adding to total, dividing by 10, rounding down/cast int …
	• … comparing check digit to character in position 6
	• … including comparison of X for 10
	
	• Calling `Enqueue` with first 6 characters **when valid**
	• … outputting appropriate message on return (for both inserted and queue full)
	• Counts **and** outputs number of invalid inputs
	e.g.
	Java
	``java
	public static void StoreItems(){
	        Integer Count = 0;
	        Integer Total = 0;
	        String Data;
	        Boolean Result;
	        Scanner scanner = new Scanner(System.in);
	        for(Integer X = 0; X < 10; X++){
	            System.out.println("Enter data");
	            Data = scanner.nextLine();
	            Total = Integer.parseInt(Data.substring(0,1)) +
	``
		6
